

For the WATS4000 Final Project I will my play is to build a weather app that will provide current weather and 5-day forecasts but also pull up screen shots based on the weather. Sunshine will display a sunny image, cloudy will have clouds, etc. Ultimately I would like the finished app to resemble yahoo weather as much as possible and display a live of the city.

I first plan on getting the basic weather app working and then editing the style sheet, and adding functionality.

Weather App 1

Enter your city:

City, State, Country

Enter State, Province or Region using Postal abbreviation and Country using the 2-letter International Postal abbreviation.

Home view with no saved cities.

Weather App 1

< Home

Current Weather Seattle

Save City

Cloudy

Scattered Clouds

Chance of Rain:
51%

Temp: 73F
Humidity: 57%
Wind: 5mph SW

Current weather view.

Weather App 1

Enter or select
your city:

City, State, Country

Your Cities:

Seattle

San Francisco

New York
